NOX FUND

IMMUTABLE · OWNERLESS · AUDITED

Earn 1.5% Daily — Guaranteed by Code, Not by a Company.

Deposit USDT on BNB Smart Chain and earn **1.5% every 24 hours** on your full deposit. Principal unlocks after **45 days**, referrals pay **20% across 7 levels**, and every payout is pulled by you — *no owner, no proxy, no pause*.

- BNB Smart Chain · Mainnet
- Audited by HazeCrypto
- Scanned by SolidityScan
- Verified source on BscScan

DAILY ROI	CAPITAL LOCK	LIFETIME CAP	REFERRAL PAYOUT
1.50%	45	547.5%	20%
of full principal, per 24h epoch	days per position	365 ROI epochs	across 7 levels

What it is

A single, self-contained Solidity contract that accepts USDT deposits, accrues a fixed daily yield per position, and pays 7-level referral commissions — with every economic parameter frozen as a compile-time constant.

What it is not

Not a fund, not a company, not a custodian, not a token sale. There are no shares, no governance votes, no treasury management and no discretionary decisions. Nobody can change the rules after deployment.

Who operates it

Nobody. The contract has no owner, no admin role and no upgrade path. The deployer wallet is empty, powerless, and its private key is published publicly to prove that nothing depends on it.

01 — PROTOCOL

The NOX Yield Engine

The NOX Yield Engine goes beyond simple staking — ROI accrues per 24h epoch against your *entire* principal, and every payout is a pull-payment you alone trigger. No custodian ever holds your claim.

⚙ How accrual actually works

Each deposit is stored as an independent **position** with its own `startTime`, `lastClaimTime` and maturity timestamp. When you call `withdrawROI(index)` the contract counts the number of **whole 24-hour epochs** elapsed since your last claim, multiplies that count by 1.5% of the position's full principal, and transfers the result.

Nothing is lost between claims. `lastClaimTime` advances by exactly the number of days credited — never to "now" — so fractional hours roll forward into your next epoch. Claim daily, weekly or once a year: the arithmetic is identical.

Worked example — 1,000 USDT position

MILESTONE	ROI ACCRUED	CUMULATIVE %
Day 1 · first epoch closes	15.00 USDT	1.5%
Day 7 · one week	105.00 USDT	10.5%
Day 30 · one month	450.00 USDT	45.0%
Day 45 · **principal unlocks**	675.00 USDT	67.5%
Day 365 · lifetime cap reached	5,475.00 USDT	547.5%
Gross at full term (ROI + principal)	**6,475.00 USDT**	**647.5%**

Illustrative model using fixed protocol constants. Actual payouts depend on pool liquidity at claim time. ROI is always calculated against the full amount recorded as your principal.

Position lifecycle

- **Open** — created on deposit, begins accruing immediately.
- **Locked** — days 0–45, ROI claimable, principal not.
- **Matured** — day 45+, principal withdrawable on demand.
- **Maxed** — 365 ROI epochs credited, accrual stops.
- **Closed** — principal withdrawn; any unpayable ROI is stored on-chain as *preserved ROI* and stays claimable.

POSITION TERMS

Daily ROI	1.50%
ROI basis	Full deposit
Accrual epoch	24 hours
Capital lock	45 days
Max ROI days	365
Lifetime cap	547.50%
Exit fee	0%
Minimum deposit	1 USDT
Max positions / wallet	200
Referral payout	20% · 7 levels
Referral lock	No lock

Why laddering works

Because a wallet may hold up to **200 concurrent positions**, each with independent timers, you can stagger entries so a new tranche matures every few days instead of locking one large sum for 45 days. Each position is claimed and unlocked separately via its own index.

Gas & token requirements

USDT (BEP-20, 18 decimals) is hardcoded in the contract — no other token is accepted. You also need a small BNB balance for gas. The first deposit requires two signatures: `approve` then `deposit`.

02 — DEPOSIT

Create a position

Approve once, deposit anytime. Your principal is yours after 45 days.

01
Connect

Link any BNB Chain wallet — injected (MetaMask, Trust, SafePal, Bitget, OKX) or any of 600+ wallets via WalletConnect QR / deep-link. NOX never requests private keys or seed phrases; the connection is read-only until you sign.

02
Approve & Deposit

Approve the USDT spend allowance, then deposit. Your position starts accruing 1.5% from the first completed 24h epoch. Enter a referrer before depositing — it locks permanently on confirmation.

03
Claim Daily

Withdraw ROI anytime from the Portfolio dashboard — per-position with `withdrawROI` or all at once with `withdrawAllROI`. Fractional time is preserved on-chain, so nothing is lost between claims.

04
Unlock Capital

After 45 days your principal is withdrawable on demand, while remaining ROI days stay claimable up to the 365-epoch cap. There is no exit fee — only network gas.

🧾 Deposit summary panel

The dApp projects your position live as you type. For a **1,000 USDT** deposit:

Daily ROI (1.5%)	**15.00 USDT**
At unlock · day 45	**675.00 USDT**
Lifetime cap · day 365	**5,475.00 USDT**
Principal returned	**1,000.00 USDT**

Quick-amount chips: 100 · 500 · 1,000 · 5,000 · MAX.

🛡️ On-chain guards enforced at deposit

- ✓ Amount ≥ **1 USDT** minimum
- ✓ Fewer than **200** existing positions
- ✓ **Self-referral** rejected
- ✓ **Circular referral** chains rejected
- ✓ Referrer must be an **active depositor**
- ✓ Unknown usernames **revert**, never silently drop
- ✓ **Reentrancy guard** on every entrypoint
- ✓ **SafeERC20** transfers throughout

💠 Where a deposit goes

DESTINATION	SHARE	ON 1,000 USDT
Credited to 7-level upline referral balances	20.0%	200.00
Retained in the shared liquidity pool	80.0%	800.00
Your recorded principal (ROI basis)	100%	1,000.00

Referral shares for upline wallets that have never deposited are skipped and remain in the pool. Referral balances are reserved on-chain, so ROI claims can never spend them.

⚠ Before you sign

Verify the contract address `0x433830E36585bdACC840E1caB419C4211bBf13f5` inside your wallet's confirmation screen — never trust a link alone. Your referrer is locked **permanently** on the first deposit and can never be changed. If you intend to use a referral link, enter it **before** depositing.

03 — NETWORK

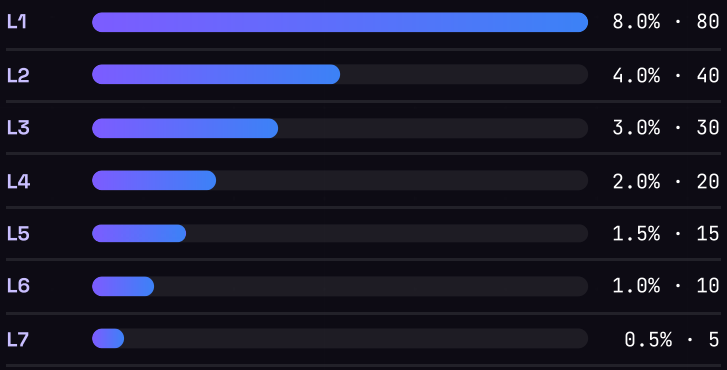

Referral engine

20% of every downline deposit, distributed instantly across seven levels.

⚡ Paid the moment they deposit

No waiting, no vesting. When someone joins through your link, **8%** of their deposit lands in your withdrawable balance *inside the same transaction* — and their referrals pay you too, down **7 levels** (20% total). Commissions are separate from your 45-day principal lock: press **Withdraw Commissions** whenever you like, with no cap and no cooldown.

📊 Commission schedule & payout per 1,000 USDT

Contract constants `REF1…REF7` = 800 / 400 / 300 / 200 / 150 / 100 / 50 basis points. Total 2,000 bps = 20.0%. Commissions are paid by the pool and are **not** deducted from the depositor — their ROI base is always their full deposit.

🧭 Three steps to earning

1. Copy your link from the dApp — or claim a free short username.
2. A friend deposits through it; your upline is locked on-chain, forever.
3. Commission is credited instantly. Withdraw any time, no lock.

You must hold an active deposit yourself (1 USDT minimum) to receive commissions.

🏷️ Vanity usernames

Claim a permanent on-chain username so your link becomes `?ref=yourname` instead of a 40-character address.

- 3–20 characters, alphanumeric only
- Cannot begin with `0x`
- One per wallet · permanent · free (gas only)
- Resolved on-chain via `resolveReferral`

👥 Downline analytics

The dApp rebuilds your team directly from on-chain `ReferralPaid` events — no backend database, nothing to trust.

Team members	**per level L1–L7**
Team volume	**derived on-chain**
Commission earned	**lifetime + pending**

Permanent & non-transferable

Your referrer is locked on your first deposit and can **never** be changed — this keeps the 7-level tree tamper-proof. Depositing with no referrer makes your account a root, also permanently.

Sharing tools built into the dApp

One-tap copy, native share sheet, plus direct share buttons for **X**, **Telegram** and **WhatsApp**. Links carry your address or username as `?ref=`, which the site reads on load and pre-fills into the deposit form.

04 — DASHBOARD

Your portfolio

Real-time position tracking, live accrual and one-click claims.

TOTAL DEPOSITED	LIVE ACCRUAL	CLAIMABLE NOW
0.00	0.000000	0.00
USDT · sum of all principals	USDT · ticks every second	USDT · whole epochs credited

ROI WITHDRAWN	REFERRAL EARNED	PRINCIPAL RETURNED
0.00	0.00	0.00
USDT · lifetime	USDT · lifetime	USDT · matured exits

📍 Position cards

Every deposit renders as its own card with a maturity countdown, a progress ring for the 365-epoch cap, unclaimed days, pending ROI and per-position action buttons. Filter the grid by **All · Locked · Matured · Closed**.

FIELD	SOURCE
Principal · start · maturity	`depositInfo()`
Days elapsed / unclaimed	`depositInfo()`
Pending ROI	`pendingROI()`
Unlock countdown	`timeUntilUnlock()`
Aggregate claimable	`pendingROIAll()`

🧱 Transaction history

Reconstructed from on-chain events only — deposits, ROI withdrawals, principal withdrawals, referral credits and referral withdrawals. Every row links straight to BscScan, so each number in the dashboard can be independently verified.

- Total deposited
- ROI withdrawn
- Principal withdrawn
- Referral earned
- Referral withdrawn
- Per-event tx hash + block

⚡ Actions

Claim All ROI	**withdrawAllROI**
Claim one position	**withdrawROI(i)**
Exit matured position	**withdrawPrincipal(i)**
Withdraw commissions	**withdrawReferral**
Claim username	**claimUsername**

All five are pull payments — funds move only when you sign.

Live data cadence

On-chain state is re-read every **30 seconds** across a pool of four public BSC RPC endpoints with automatic failover; accrual interpolates between polls so the counter never stalls. A global stats bar shows pool liquidity, ROI paid out and total participants from `contractInfo()`.

Insufficient liquidity behaviour

If the pool cannot cover a claim the transaction **reverts** and nothing is lost or consumed. On principal withdrawal, ROI that cannot be paid immediately is written to storage as **preserved ROI** and stays claimable later.

05 — PROJECTION

Yield calculator

Model returns across the full 365-epoch lifetime of a position.

ROI by deposit size and duration (ROI only — principal returned separately)

DEPOSIT	DAILY	WEEKLY	MONTHLY (30D)	AT UNLOCK (45D)	180 DAYS	CAP (365D)
100 USDT	1.50	10.50	45.00	67.50	270.00	547.50
500 USDT	7.50	52.50	225.00	337.50	1,350.00	2,737.50
1,000 USDT	15.00	105.00	450.00	675.00	2,700.00	5,475.00
5,000 USDT	75.00	525.00	2,250.00	3,375.00	13,500.00	27,375.00
10,000 USDT	150.00	1,050.00	4,500.00	6,750.00	27,000.00	54,750.00
ROI as % of principal	1.5%	10.5%	45%	67.5%	270%	547.5%

Gross return at the 45-day unlock

The calculator in the dApp lets you slide deposit (100 → 100,000 USDT) and duration (1 → 365 days) and renders a live accrual chart. At the default 1,000 USDT / 45-day setting:

ROI percentage	67.50%
Total ROI	675.00 USDT
Principal returned	1,000.00 USDT
Gross return	1,675.00 USDT

Referral earnings estimator

A direct referral depositing 1,000 USDT pays you **80 USDT instantly** at L1. If that person brings someone who deposits 1,000 USDT you receive 40 USDT at L2, then 30 · 20 · 15 · 10 · 5 USDT down to level 7 — all credited the moment each deposit confirms.

Model, not a forecast

Every figure on this page is arithmetic from fixed contract constants. It assumes the pool is solvent at every claim. **It is not a prediction of what you will receive.** Actual payouts depend entirely on pool liquidity at claim time.

Claim rhythm is free

Claiming daily or every 60 days yields the identical total — `lastClaimTime` advances only by whole credited days.

Cap is per position

The 365-epoch / 547.5% ceiling applies to each deposit individually, not to the wallet.

No compounding built in

ROI does not auto-compound. Re-depositing claimed ROI simply opens a new, independent position.

06 — SECURITY & AUDITS

Trustless by design

Independently audited by HazeCrypto, continuously scanned by SolidityScan, and verified open-source on BscScan. Every economic parameter is a compile-time constant — nobody can change them. Ever.

Manual security audit

HazeCrypto

Full-scope manual review of the deployed NoxFund logic — ROI accounting, referral distribution, reentrancy and withdrawal paths.

hazecrypto.net/audit/Noxfund ↗

◈ Automated analysis

SolidityScan

Continuous static analysis and threat scoring of the verified mainnet bytecode at `0x4338…13f5`.

solidityscan.com/quickscan ↗

⛓ Open source

BscScan Verified

Read every line of the immutable source and replay each state-changing call yourself.

bscscan.com/address/0x4338...13f5#code ↗

No Owner

Zero admin functions, zero privileged roles, no `onlyOwner` anywhere in the bytecode.

No Proxy

Direct implementation. No `delegatecall`, no upgrade slot, no hidden logic swap.

No Pause

The contract cannot be frozen, blacklisted or throttled. It runs perpetually.

Immutable Constants

ROI, lock period, fees and referral tiers are hardcoded `constant` values.

Pull Payments

Funds only move when *you* sign. No push transfers, no sweeper, no forced exits.

Reentrancy Guarded

Every state-changing entrypoint is protected and uses `SafeERC20` transfers.

🔑 The deployer key is public

The deployer wallet holds no funds, receives nothing and has no rights over the contract. To prove that nothing depends on it, its private key is published on the website. **Never send funds to this address.**

DEPLOYER ADDRESS
`0xA22a837716C32448D893006a99624177ea54FDe1`

⚠ Why does my wallet show a "flagged site" warning?

Wallets such as **MetaMask, SafePal, Trust Wallet** and WalletConnect automatically apply precautionary warnings to *all* DeFi yield and ROI protocols — regardless of their actual security status. This is a blanket heuristic applied industry-wide to any site that interacts with smart contracts offering daily returns, **not a finding specific to NOX FUND**.

The contract has been independently audited by HazeCrypto and is continuously analysed by SolidityScan; the code is fully open-source and verified on BscScan. The warning is a standard false positive. **It does not, however, reduce the economic risk described on page 01.**

Audit fixes incorporated before deployment

- ✓ Usernames beginning with `0x` blocked to prevent resolver collisions
- ✓ Unknown referral usernames revert instead of silently defaulting to the zero address
- ✓ Circular referral chains detected and rejected before the upline is locked
- ✓ Preserved-ROI accounting so a principal exit can never destroy unpaid ROI
- ✓ Deposit size bounded by `uint128` to eliminate overflow paths
- ✓ Referral balances excluded from the available-balance calculation used by ROI claims

07 — ARCHITECTURE

System architecture

One immutable contract holds everything — balances, positions, the referral tree and usernames. There is no database, no backend ledger and no off-chain account system that could ever *hold*, *move* or *reconcile* user funds.

1 noxfund.sol — the entire protocol

Solidity, deployed to BNB Smart Chain mainnet and verified on BscScan. A single, self-contained implementation holding all state: every position with its own timers, the 7-level referral tree, claimed username registry and referral balances. Transfers use `SafeERC20` and every state-changing entrypoint is wrapped in a custom `nonReentrant` guard.

- ✓ **No owner** — no privileged role exists in the bytecode
- ✓ **No proxy** — direct implementation, no upgrade slot
- ✓ **No pause** — it cannot be frozen or throttled
- ✓ **No sweeper** — no function can drain the pool
- ✓ **Constants only** — economics fixed at compile time

🔌 Contract interface

STATE-CHANGING	READ-ONLY
`deposit(amount, refAddress)`	`pendingROI(user, i)`
`depositWithUsername(amount, name)`	`pendingROIAll(user)`
`withdrawROI(index)`	`depositInfo(user, i)`
`withdrawAllROI()`	`depositCount(user)`
`withdrawPrincipal(index)`	`timeUntilUnlock(user, i)`
`withdrawReferral()`	`contractInfo()`
`claimUsername(username)`	`referralChain(user)`
— no other mutating functions exist —	`getConstants()`

Events: `Deposited` · `ROIWithdrawn` · `PrincipalWithdrawn` · `ReferralPaid` · `ReferralWithdrawn` · `UsernameClaimed`. Downline and history views are reconstructed purely from these logs.

🌐 Deployment targets

Network	**BNB Smart Chain**
Chain ID	**56 · 0x38**
Gas token	**BNB**
Deposit token	**USDT (BEP-20)**
Decimals	**18**
Explorer	**bscscan.com**

Where your state lives

Positions, referral links, usernames and balances are stored **in contract storage** — not in any database. Anyone can read them directly from a public BSC node without touching nox.fund, and they survive independently of any website remaining online.

Verifiability checklist — do this yourself

- ✓ Open the verified source on BscScan and search for `owner` — there is none
- ✓ Call `getConstants()` and compare every value to page 03 of this document
- ✓ Read `contractInfo()` for live pool balance and participant count
- ✓ Import the published deployer key into a throwaway wallet to confirm it is empty and powerless

08 — ANSWERS

Frequent questions · part 1 of 2

How exactly is the 1.5% daily ROI calculated?

ROI accrues per completed 24-hour epoch against your full principal. A 1,000 USDT deposit earns 15 USDT per full day, up to 365 epochs (547.5% lifetime).

When can I withdraw my principal?

45 days after that specific deposit's timestamp. Each position matures independently — `withdrawPrincipal(index)` becomes callable the second the lock expires, and your unclaimed ROI is paid alongside it when liquidity allows.

What happens if the pool lacks liquidity when I claim?

The transaction reverts and nothing is lost. For principal withdrawals, any ROI that cannot be paid immediately is stored on-chain as *preserved ROI* and remains claimable later via `withdrawROI`.

How do referral rewards work?

When someone deposits, 20% of that deposit is split across their 7 upline levels: **8% / 4% / 3% / 2% / 1.5% / 1% / 0.5%**. Each share is credited to that upline's referral balance *inside the same transaction* — the moment your friend deposits, you can withdraw it.

How much would I earn from one referral?

If a direct referral deposits 1,000 USDT you receive **80 USDT instantly** (L1). If they bring someone who deposits 1,000 USDT you receive 40 USDT (L2), then 30, 20, 15, 10 and 5 USDT down to level 7.

Do I need to deposit to earn referral commissions?

Yes — you need an active deposit yourself (1 USDT minimum). Referral shares for wallets that have never deposited are skipped, so make your own deposit first and then share your link.

Is there a lock or limit on withdrawing commissions?

No lock and no cap. Referral commissions are separate from your 45-day principal lock — press **Withdraw Commissions** whenever you like. They are reserved on-chain, so ROI claims can never use them.

How do I see who is in my team?

Connect your wallet and open the **Your Downline** panel in the Referral section. It lists every member that has paid you, their level (L1–L7), how much they deposited and how much you earned from them — all read directly from on-chain events.

Can I use a short referral link?

Yes. Claim a free vanity username (3–20 letters or numbers, one per wallet, permanent) and your link becomes `?ref=yourname` instead of a long wallet address.

Can I change my referrer later?

No. Your upline is permanently locked on your first deposit, which keeps the 7-level tree tamper-proof. Referrers must themselves be active depositors to receive commissions.

What if I join without a referral link?

You can deposit with no referrer and your account becomes a root. It is locked that way after your first deposit, so if you have a referrer, add it before depositing. Your own downline still pays you as normal.

08 — ANSWERS

Frequent questions · part 2 of 2

Do referral payments reduce my friends' earnings?
No. Commissions are paid by the pool, not deducted from the person who deposits — their ROI base is their full deposit.

Do I lose time if I claim irregularly?
Never. Claims advance `lastClaimTime` by exactly the number of whole days credited, so fractional hours roll forward into your next epoch.

Is there any way the team can take my funds?
No. There is no owner, no withdraw-all function and no upgrade path. The only outbound transfers are fixed protocol transfers at deposit time (hardcoded in the contract) and user-initiated pull payments.

What is the minimum deposit and which token is used?
The minimum is 1 USDT (BEP-20) on BNB Smart Chain. You also need a little BNB for gas. The first deposit takes two confirmations: approve USDT, then deposit.

Is there a fee to withdraw?
No. There is no exit fee — you only pay normal network gas.

How many positions can one wallet hold?
Up to 200 concurrent deposits, each tracked with its own start time, claim history and maturity — ideal for laddering entries.

Why does my wallet warn that nox.fund is "flagged as unsafe"?
This is a standard false positive. Wallets like **MetaMask, SafePal and Trust Wallet** apply an automated heuristic warning to *all* DeFi yield/ROI protocols as a blanket precaution — it is not a finding against NOX FUND specifically. The contract has been manually audited by HazeCrypto, continuously scanned by SolidityScan, and is fully open-source and verified on BscScan.

Which wallets are supported?
Any BNB Chain wallet. Injected browser wallets are detected automatically; selecting **All Wallets** opens a WalletConnect session — QR code on desktop, deep-link on mobile — covering 600+ wallets including Trust, Bitget, OKX, TokenPocket, Binance Web3, Rainbow and Ledger.

Is there a mobile app or custodial account?
No. NOX FUND is a website that talks to a smart contract. There is no account, no password, no KYC and no custody. Your wallet *is* your account, and you alone hold the keys.

What is the biggest risk I am taking?
Pool insolvency. Payouts come from a shared liquidity pool funded by deposits. If inflows slow, withdrawal transactions begin reverting and capital can become permanently unrecoverable. No audit, guarantee or contract property removes this risk. Only deposit what you can afford to lose entirely.

09 — COMMUNITY

Join the NOX Telegram

Protocol announcements, payout proofs, referral strategy and live support from the community — all in one room. This is where NOX holders coordinate first.

Instant protocol updates
Deposit, ROI and referral events pushed straight from the chain.

Verified payout proofs
Every claim is a public transaction — verify it on BscScan.

Referral partner matching
Find teammates and share strategy with other promoters.

24/7 peer support
Community-run help, plus an educational bot answering common questions.

t.me/noxfundchat · The Telegram bot is read-only: it watches public events and broadcasts educational content. It can never move, request or custody funds, and will **never** ask for your seed phrase or private key. Treat any direct message claiming otherwise as a scam.
